FSM AgenticAI Workflow Description

The FSM application should implement 8 Bedrock AI agents coordinated by a central orchestrator. The agent details are given below

	Agent	Purpose	Key Functions
1	**Orchestrator**	Workflow coordination	Multi-agent workflow management and decision routing
2	**HVAC Monitoring**	System surveillance	Anomaly detection and predictive failure analysis
3	**Parts Inventory**	Supply chain management	Inventory tracking, predictive ordering, supplier coordination
4	**Technician Scheduling**	Resource allocation	Skill-based assignment, route optimization, availability management
5	**Customer Communication**	Stakeholder engagement	Automated notifications, appointment scheduling, status updates
6	**Customer Authentication**	Security & access	Identity verification and service agreement validation
7	**Billing & Invoicing**	Financial operations	Real-time cost calculation, automated invoicing, payment tracking
8	**Technical Documentation**	Knowledge management	LLM-powered procedure generation, safety protocols, compliance docs

These agents are built using Strands SDK. the instructions for Strands SDK can be found here https://github.com/strands-agents/sdk-python

The agents should read and update the FSM data using the data services lambda functions.
